Cross breeding

Researchers have developed a new strain of rice that is resistant to pests and diseases, which could revolutionize the food security of developing countries.

The new strain is a result of years of research and development by scientists at the International Rice Research Institute (IRRI) in the Philippines.

The new rice has been tested in several countries and has shown promising results. It is expected to be widely adopted by farmers in the coming years.

The researchers are also working on developing new strains of crops that are more suitable for different regions and climates.

The development of these new crops is a strong indication of the potential for agricultural research to play a major role in addressing global food security challenges.
